Cursor Prompt — Muscle Habit Adaptive Fitness App (v2)

Copy everything in the block below and paste it into Cursor as your first message (or save it as `MUSCLE_HABIT_SPEC.md` in the repo root and tell Cursor to follow it). Replace the two [BRACKETED] placeholders before running.

```
You are a senior full-stack product engineer. Build me a complete, polished, product

## THE PRODUCT

"Muscle Habit" — an adaptive fitness coaching app for busy professionals (28-50) with

## TECH STACK

- Next.js (App Router) + TypeScript + Tailwind CSS
- Charts with Recharts. State with React context + localStorage (no backend, no login
- Mobile-first responsive PWA (installable on phones), light theme
- Clean, commented code with a /docs folder explaining the architecture

## BRANDING (STRICT)

- Brand: Muscle Habit. Logo image at [PATH-TO-LOGO.jpg] — place top-left of the nav,
- Colors: Dark Slate Navy #2B3B4C (headlines, primary text), Vibrant Orange #FF4A00
- Rule: navy carries the message, orange triggers the action. Never large orange text
- Typography: a bold condensed athletic sans for headings (e.g., Oswald or Anton), a
- Voice: encouraging, direct, zero guilt. Never show red warnings, streak-loss threat

## FEATURE 1 — ONBOARDING + PERSONAL & LIFT DATA ENTRY

A friendly step-by-step onboarding (one question per screen, progress dots):
1. Baseline: sex, age, height, current weight, goal weight
2. Experience level: beginner / returning / intermediate
3. Time budget: days per week (2-6) and minutes per session (20/30/45/60)
4. Equipment: full gym / dumbbells only / bodyweight
5. Goal: lose fat / build muscle / both / general health

Then a dedicated **"My Numbers"** data-entry step (also reachable anytime from the na

**Personal stats:** weight and height, with a weigh-in log (date + weight) so the app

**Lift data:** for each main lift (squat, bench, overhead press, deadlift/RDL, row, p
- The weight they lift and the reps they perform with it
- A toggle on each entry: **"Working weight"** (the weight they train with for reps)
- If they enter a working weight + reps, auto-calculate and display their estimated 1
- Store every entry as a dated history point per lift, so each lift has a progression
- Allow multiple lifts to be skipped — the app works with partial data and fills in

## FEATURE 2 — PROGRAMS: PRELOADED TEMPLATES + THE INTERACTIVE COACH BUILDER
```

Two ways to get a program, both first-class:

A. Preloaded programs. A library of ready 12-week programs (including a "Time-Cru

B. The Coach Builder — build it together. An interactive, chat-like guided flow v
- The coach asks 3-5 short questions (goal emphasis, priority muscles or weak points
- After each answer, the coach proposes the next piece of the program and explains wh
- The user can accept, tweak, or reject each piece: swap exercises (the coach offers
- The coach validates the result against evidence-based guardrails (see Feature 3) ar
- The finished program is saved as "My Program" alongside the templates and can be re
- The whole conversation should feel like a real coaching dialogue — short messages,

Program generation rules (both paths): full-body sessions built from a movement-patte

FEATURE 3 — PROGRESSION TRACKING & ADAPTIVE TRAINING ENGINE

The heart of the app. It watches the user's logged data and adjusts the program autor

What it tracks:
- Every logged workout feeds each lift's history: top set (weight × reps), estimated
- Body-weight trend from the weigh-in log (4-week rolling trend, not single weigh-ins
- Session completion rate and recovery audit answers

How it adapts (evidence-based rules — implement each explicitly):
- **Double progression trigger:** when the user logs the top of a rep range on all se
- **Volume guardrails:** optimal hypertrophy volume is roughly 10-20 hard sets per mu
- **Plateau protocol:** if a lift's estimated 1RM hasn't improved for 2 consecutive v
- **Deload triggers:** a scheduled deload at weeks 4 and 8, plus an automatic sugges
- **Goal-specific adaptation:** if the goal is fat loss and the body-weight trend is
- **Every adaptation appears in a visible changelog** ("Adjusted Feb 12: bench workir

FEATURE 4 — WEIGHT-LOSS PREDICTOR

A projection engine on the dashboard:
- Compute BMR with the Mifflin-St Jeor equation, apply an activity multiplier from th
- Model a sustainable deficit (default ~20% below maintenance, capped at a weight-los
- Output: a line chart of projected weight over 12 weeks with a shaded confidence bar
- Once the user has real weigh-in history, overlay their actual trend line on the pro
- Show honest disclaimers in Mid Slate: "Projections, not promises. Your body adjusts
- If the goal is unrealistic, say so kindly and propose the closest healthy version o

FEATURE 5 — ADAPTIVE RESEARCH ENGINE ("The Habit Lab")

The app's key differentiator. A feed of curated "Research Updates" the coach sends to
- Seed it with 10 realistic example updates in /data/research.json, each with: id, da
- Updates may target the same rules the adaptation engine uses (volume ranges, rep zo
- When a new update arrives, show a friendly in-app notification: "New research sugge
- If the user agrees, the program updates visibly with a changelog entry and the set
- Build the architecture so I can add real updates later by editing the JSON — no coo

FEATURE 6 — POSITIVE REINFORCEMENT SYSTEM

- On login/open: a warm, varied welcome-back message (rotate a bank of 20+ messages,
- After logging any workout: immediate specific praise + a visual celebration (subtle
- Streaks framed positively: "You've trained 3 weeks in a row" — never loss-averse co
- A "Habit Strength" score (0-100) that grows with consistency and decays gently — wi

```
- Micro-celebrations for logging weigh-ins, completing check-ins, and week milestones

## PAGES / STRUCTURE

1. Onboarding flow → 2. Dashboard (today's session, predictor chart with actuals over
- Bottom tab nav on mobile, sidebar on desktop
- Include a "Shop" link in the nav pointing to [YOUR-SHOP-URL] (sells my PDF guides a

## QUALITY BAR (definition of done)

- Runs with npm install && npm run dev, zero errors, zero console warnings
- All six features fully functional with the localStorage data layer
- This exact flow works end-to-end: enter personal stats and lift numbers (one as wor
- Accessible: keyboard navigation, focus states, AA contrast
- Looks genuinely premium — generous whitespace, consistent spacing scale, smooth 200
- Write a README with screenshots-in-place instructions and a 3-minute demo script I

Start by creating the project structure and a brief plan, then build it all. Do not s
```

Tips for best results in Cursor

1. **Paste it as one message** — Cursor handles long, structured prompts well; the section headers act as its checklist
2. **Drop the logo file in first** (e.g., `public/muscle-habit-logo.jpg`) and put the real path in the placeholder
3. If the first build stalls, reply: "Continue. Complete the definition of done checklist item by item."
4. If the Coach Builder feels shallow, reply: "Deepen the Coach Builder: add at least 15 coach dialogue branches and make it validate every user edit against the volume guardrails."
5. After it builds, ask Cursor: "Now add a dark mode using the same palette" — the color system makes this easy
6. When you're ready for real research updates, send me new studies and I'll write the research.json entries in the app's format
